

## What's New in *FitAll* 6.2

*FitAll* version 6.2 has been enhanced to include the following new features:

1. ***FitAll* Research Edition** version 6.2 can act as an ActiveX (COM / Automation) server.

This means that other programs, such as data acquisition programs, written in languages like C, Delphi, LabView, Visual Basic, etc., can start ***FitAll***, transfer data to ***FitAll***, have ***FitAll*** do the regression analysis and retrieve the results of the analysis from ***FitAll***.

A client application, **FaClient**, that demonstrates how ***FitAll*** can be controlled by another program is included with ***FitAll* Research Edition**.

2. User defined ***FitAll* Function Libraries**, FFLs, can now be created using Delphi 5 to 2010 and **Free Pascal**, an open source Pascal compiler, available from [www.freepascal.org](http://www.freepascal.org).

3. A Check for Updates selection is now available under ***FitAll***'s Help menu as well as under MS Windows' menu selections Start, Programs, FitAll62.

This makes it easier for you to check for updates and to keep your copy of ***FitAll*** up to date.

Note: This feature is disabled in the Evaluation Edition of ***FitAll***.

4. By default, ***FitAll*** is now installed in a directory that is accessible to all users of the computer. This is especially important on systems that are running MS Windows Vista or 7.

(Note: To install or uninstall ***FitAll*** a user with "Administrator Permissions" is still required).

5. Several minor bug fixes, such as ensuring that the colour of grid lines in a graph are properly saved and restored when a graph window is closed and then reopened.
